Summary

Final-year Computer Science student with hands-on backend and Python experience across production-style projects — FastAPI services, low-latency ML inference pipelines, and multi-provider LLM systems. Comfortable working close to the metal on performance and reliability (sub-30ms inference, API rate-limit/failover handling), with a habit of understanding a system's internals before shipping code. Actively building with AI coding agents (Claude Code) as part of the daily workflow, not just as a novelty.

Education

VIT Bhopal University

Sep. 2023 – June 2027

B.Tech Computer Science, Cloud Computing and Automation

CGPA- 8.30

Achievements

Won **25,000** and the **"Most Enthusiastic Presenter"** award at Online Innovation Summit 6 for pitching a startup idea to real investors alongside a co-founder.

Experience

Clever Harvey

Business Development Intern

Remote

- Analyzed market trends and customer data to identify new partnership opportunities, contributing to a 30% increase in qualified leads for the tech education platform.
- Collaborated with cross-functional marketing and product teams to align business strategy with customer feedback and product capabilities.
- Translated product value and technical concepts for potential clients into actionable insights for the development team, sitting directly at the product/customer interface.
- Completed a Junior MBA (Clever Harvey) covering business strategy and operations fundamentals; awarded a Letter of Recommendation for performance.

Projects

Skincare Vision Agent | Python, FastAPI, YOLOv8, ONNX Runtime, WebSockets

[github](#)

- Fine-tuned YOLOv8n on the ACNE04 dataset for real-time skin-condition detection, optimizing inference latency to under 30ms via ONNX Runtime.
- Built a FastAPI backend with WebSocket streaming to serve live model predictions, paired with an LLM-based recommendation layer.

TurboQuant | Python, PyTorch, Transformers, Model Quantization

[github](#)

- Implemented KV-cache quantization methods (QJL, PolarQuant) from a Google Research ICLR 2026 paper to reduce GPT-2 inference memory footprint.
- Benchmarked quality degradation across precision levels, tracking perplexity from 40.48 (FP32) to 45.78 (4-bit) to 76.29 (3-bit).

Vector Space Explorer | Python, FastAPI, ChromaDB, Plotly.js

[github](#)

- Built a FastAPI backend and interactive 3D Plotly.js visualization tool to explore high-dimensional embeddings from a 2,000+ paper arXiv corpus.
- Implemented a PCA → UMAP/t-SNE dimensionality-reduction pipeline with HDBSCAN clustering to surface semantic structure in the data.

F(x) Scale | Python, Image Processing, Vercel

[live](#) | [github](#)

- Built a live image vectorization and transformation platform applying Fourier Transform and K-means-based conversion techniques.
- Deployed on Vercel with a public demo, allowing users to upload and transform images directly in the browser.

Technical Skills

Languages: Python, Java, C++, SQL, JavaScript

Backend & Frameworks: Django, FastAPI, REST APIs, Object-Oriented Programming

Databases: PostgreSQL, MySQL, ChromaDB (vector DB), Database Design

Cloud & DevOps: AWS (EC2, VPC, Elastic Beanstalk), GCP, Docker, Git, CI/CD

AI Tooling: Claude Code, Antigravity, OpenRouter, PyTorch, ONNX Runtime, YOLOv8, LLM/RAG Pipelines
